

As OPEC+ meets this week, UAE emerges as main laggard

LONDON/DUBAI (Reuters) – The United Arab Emirates has emerged as a major laggard in delivering oil output cuts in August, figures used by OPEC+ showed on Wednesday, as the group meets this week amid signs of a faltering demand recovery.

Compliance with oil production cuts in August among OPEC+ members was seen at around 101%, four OPEC+ sources told Reuters on Wednesday, a figure calculated using production assessments from six secondary sources.

Several of the secondary sources showed the UAE missed its target in August, with the International Energy Agency (IEA) giving OPEC's third-largest producer a score of only 10%, significantly lower than an average of around 80% from other sources.

The UAE had said its overproduction was due to higher demand for associated gas for power generation, driven by hot weather

and more people ditching foreign holidays, adding that it will compensate for the August rise by reducing its oil supply in the coming months.

Abu Dhabi National Oil Company (ADNOC) will reduce crude oil supplies to term buyers in October and November.

A technical committee of the alliance of the Organization of the Petroleum Exporting Countries and its allies, known as OPEC+, meets on Wednesday to discuss market fundamentals and compliance.

One of the OPEC+ sources said the UAE will submit its plan to compensate for its overproduction in August.

Secondary source data including from the IEA, price reporting agencies S&P Global Platts and Argus Media, and publication Energy Intelligence have shown that laggards Iraq and Nigeria have by and large made efforts in August to compensate for their overproduction.

A higher-level ministerial monitoring committee meets on Thursday, and is unlikely to announce recommendations for expanding the oil cuts – currently at 7.7 million bpd until the end of the year – any further, sources told Reuters this week.

The meeting, instead, is expected to extend the compensation period for countries such as Iraq and Nigeria for their past overproduction, and discuss underperformance from other members, including the UAE.

The meetings come against the backdrop of worsening demand forecasts, including from OPEC.

In its monthly report, the organisation said it expected world oil demand to fall by 9.46 million barrels per day (bpd) this year, more than the 9.06 million bpd decline expected a month ago. [OPEC/M]

The OPEC forecast chimes with a worsening demand outlook outlined by the International Energy Agency and major oil industry producers and traders.

BP Clean Energy Push Starts With 5-Year Dash on Solar, Wind

BP Plc's journey from oil major to clean energy giant will start with a five-year sprint to dramatically boost wind and solar power.

By 2025, the company intends to have approved more than 20 gigawatts of renewable energy projects, an eightfold increase from 2019, Dev Sanyal, BP's executive vice president of gas

and low-carbon energy, said in a online presentation on Tuesday.

Most of that would be solar – putting BP on a par with today’s biggest generator of electricity from the sun. The company also plans big investments in wind, following on from last week’s \$1.1 billion deal with Equinor ASA.

“With falling costs comes real growth,” Sanyal said. “Renewables have become the fastest growing source of energy and we see this continuing over the next decade and beyond.”

This rapid expansion would just be the start of the London-based oil giant’s transformation into a low-carbon integrated energy company. Chief Executive Officer Bernard Looney has pledged to eliminate all net greenhouse gas emissions from BP and its customers by 2050.

A series of presentations this week aims to show he can achieve this while still delivering competitive returns. Investors may need some convincing, after seeing their dividends cut in half last month.

Trading Gains

BP’s in-house trading operations are at the heart of Looney’s pledge to move away from fossil fuels without sacrificing profits. Renewable energy projects typically gives returns of 5% to 6%, Looney said, but the company’s expert traders can add about 2 percentage points to that.

Lightsource BP, which currently manages about 2 gigawatts of solar plants, is already achieving returns of 8% to 10% and “we actually believe it can do better,” Looney said. Access to low-cost funds, and integration with the rest of BP and its project management experience can boost returns, said Sanyal and Looney.

BP will gradually expand its electricity trading over the next

five years, increasing the amount of power it buys and sells annually by about 40% to 350 terawatt hours.

Of the 20 gigawatts of renewable energy capacity BP intends to begin developing over the next five years, 83% will be solar, 15% wind and 2% bio-energy, Sanyal said.

That much solar would give BP about the same capacity as is currently owned by the world's biggest operator, China's State Power Investment Corp. Ltd, according to data from BloombergNEF.

Solar power will be crucial for achieving the breakneck pace of growth BP laid out. It is relatively quick to install, taking as little as 18 months from concept to construction, Sanyal said. That's much faster than massive offshore wind farms, which can take a decade to plan and construct.

By 2030, BP plans to have taken the final investment decision on 50 gigawatts of low-carbon energy capacity, and be trading 500 terawatt hours of power each year.

On bio-energy, the company says it will more than double its 2019 production to 50,000 barrels a day by 2025, and 100,000 by 2030. These fuels will help sectors that are hard to electrify, like aviation, marine and heavy goods vehicles, Sanyal said.

BP currently makes biofuels in a joint venture with Bunge Ltd. in Brazil, produces biogas in the U.S. and processes some renewable fuels within its refining portfolio.

"We see these businesses as generating returns of around 15% or higher," Sanyal said. "It competes well within our disciplined financial framework."

The Solar-Powered Future Is Being Assembled in China

On a recent morning in central China, workers in blue jumpsuits and white masks placed clamps around a bar of shiny metal and fed it into a powerful cutting machine. The bar was an ingot made of polysilicon, a heavily refined cousin of the same material that makes up sand. Inside the cutter, it was sliced into thousands of small squares slightly larger than a CD case and thinner than a thumbnail. These wafers would then be shipped on to other factories to be infused with conductive elements such as phosphorous and boron, then wired into cells and assembled into panels—the base unit of solar energy generation.

The owner of this factory, Longi Green Energy Technology Co., is the world's largest producer of solar wafers and the world's largest solar company by market value. As of the end of last year it created about 1 of every 4 wafers made anywhere on the planet, and since then it's announced at least five projects to expand its factories or build new ones. Despite a pandemic that may slow the growth of new solar power

installations for the first time in decades, Longi expects its production capacity by the end of 2020 to have increased by two-thirds compared with 2019.

Longi and the other Chinese companies that dominate solar—collectively they control at least 60% of global capacity for every step in the supply chain—are playing a risky game. The short history of the solar industry is a tale of repeated boom and bust, with abrupt technological and policy developments rendering multibillion-dollar investments obsolete. Industry leaders one day have, again and again, become bankruptcy filers the next.

The bet in China is that this time is different. Plunging costs have left solar the cheapest form of energy in parts of the world. Subsidies are disappearing as it becomes more competitive with other forms of electric generation, making demand less dependent on political decisions. And advances in energy storage are opening a tantalizing possibility: that solar could, in the near future, replace fossil fuels in many places. “We believe the solar market will maintain the trend of rapid growth,” says Li Zhenguo, Longi’s billionaire president. A physicist by training, he founded the company in 2000, naming it for a university principal who’d impressed Li with his academic rigor. “Current global production capacity, including Longi’s, is nowhere near enough to meet the coming demand.”

Longi dates to a time when Chinese solar manufacturers were relying primarily on cheap labor to undercut more established players from the U.S. and Europe. That strategy can collapse once wages rise, as they have in China. But, in Li’s telling, Longi was focused on coming up with a product that could compete in the longer term.

That aim led the company to make a momentous choice early on. There are two ways to make the blocks that solar wafers are sliced from: by cooling molten silicon into one homogeneous

structure or encouraging it to crystallize from different points. The first approach, known as mono-crystalline, provides greater conductivity and efficiency. But it's more expensive than multi-crystalline products, which most manufacturers favored in their efforts to compete with cheap fossil fuel generation.

Li decided that Longi, which in its early years relied on other companies to turn its wafers into cells and panels, would focus on mono fabrication, even if it meant losing out on short-term sales to less-expensive producers. For a long time the choice was eccentric; as recently as 2014, mono made up only 20% of the market. But around that time, China began to heavily subsidize solar installations, turbocharging demand and providing manufacturers with an incentive to compete on technology, not just cost. As its clout grew, Longi expanded vertically, and now it competes in nearly every part of the supply chain. The subsidies "transfused blood to the manufacturing sector," says Yali Jiang, a BloombergNEF analyst in Hong Kong.

It's now clear that Longi's bet paid off. Li estimates mono will account for 90% of the market in 2020—a development that's helped the company establish a commanding position. Part of the explanation is that, as costs have fallen, planners have placed a higher priority on mono's superior efficiency. This preference is reflected in Longi's \$37 billion market capitalization on the Shanghai stock exchange, by far the highest of any solar company. Its success, Li says, came from picking a technological horse early, sticking with it, and "looking for measures to rapidly put it into production."

As dominant as Longi might appear, no one stays on top of the solar industry for long. Yingli Green Energy Holding Co. was the world's biggest maker of solar panels as recently as 2013, but aggressive borrowing to fund new production combined with a plunge in solar equipment prices drove it to the brink of

collapse. In all, about 180 solar manufacturers have exited the industry or gone bankrupt in the past four years, according to Jiang.

Longi is trying to avoid their fate by not overextending itself financially. It's managed to keep a lid on labor costs by boosting productivity, sometimes at the cost of the so-called green jobs that politicians in China and the West love to promote. At a wafer plant not far from Longi's headquarters in the ancient imperial capital of Xi'an, producing 350 megawatts' worth of product required about 1,000 people in 2010. Today its output is equivalent to 6,000 megawatts, with the same number of employees. At a nearby panel plant, the company's smallest, only 100 or so workers are needed to operate a facility the size of 10 basketball courts. During a recent visit, the company was testing a packaging system that could allow it to get rid of forklift drivers and other logistical staff.

Cost-cutting can't fully neutralize the other major threat to China's solar industry: politics. The U.S. and European Union have periodically targeted Chinese manufacturers with anti-dumping tariffs since the early 2010s, claiming that subsidies allow them to sell below cost. The U.S.-China trade war kicked off in 2018 with duties on panels, and India, which is trying to reduce the economic influence of its giant neighbor, recently extended tariffs that had been set to expire on Chinese solar products.

China's solar industry is nonetheless growing rapidly. According to BloombergNEF data, at the end of 2019 Chinese panel factories had an annual capacity of 193 gigawatts, 60% more than was installed worldwide in that year. Planned expansions could increase that total by more than half.

There's an argument to be made that Chinese solar leadership is at worst benign and at best a source of considerable innovation. The raw materials for panels are inexpensive and

abundant, and it would be easy for companies in places such as Malaysia and Vietnam to set up factories if Chinese producers raised prices. The hothouse atmosphere of China's industry, meanwhile, has encouraged manufacturers to drive down costs. Measured per watt of output, the average price of panels has plunged 91% since 2010.

Solar optimists believe developments such as these might leave the world on the verge of an inflection point. In many places, generating electricity from the sun is now significantly less expensive than doing so from coal or natural gas. (Picking a location with sunny weather, as well as cheap land and financing, helps a lot, too.)

There's also been significant progress on the technology's biggest problem: that it can only generate electricity when the sun is out. When solar was primarily a supplement to traditional power plants, that wasn't a major concern, because power demand tends to peak in daytime. But it becomes a serious constraint as more panels are installed, creating a daytime surplus that's not useful at night. Engineers are refining a huge range of storage technologies, from improved batteries to "pumped storage" systems, which use solar electricity to send water uphill during daylight hours, releasing it through turbines when needed.

None has yet emerged as a game-changing solution, but Li is bullish on batteries, and he expects that a combination of live generation and storage will be enough to replace fossil fuels around the clock in at least some locations within a decade. He predicts that demand for solar installations will triple by 2025, to 300 gigawatts a year, before hitting 1,000 gigawatts in 2030. Those projections are wildly optimistic, however: BloombergNEF expects the 2030 figure to be closer to 200 gigawatts annually.

Whatever the rate of growth, the economics of the solar market "have significantly improved in the past decade," Li says.

Now, “energy is going to be more electrified, and electricity will be cleaner.” –*With Dan Murtaugh and Feifei Shen*

Elliott Discloses Stake in Takeover Target Noble Energy

Activist investor Elliott Management Corp. has taken a stake in Noble Energy Inc., the energy explorer that agreed in July to sell to Chevron Corp. for about \$5 billion.

The stake was disclosed in a filing Tuesday with the U.S. Federal Trade Commission. Noble Energy and the New York-based hedge fund run by Paul Singer were granted early termination under the FTC’s Hart-Scott-Rodino Act – a requirement when an investor buys shares in a company above a certain threshold and seeks to hold discussions about such things as strategy or management changes.

The size of the stake and Elliott’s intentions aren’t known. Representatives for Elliott and Noble Energy weren’t immediately available for comment.

Chevron agreed to buy Noble Energy for the equivalent of

roughly \$10.38 a share at the time in the all-stock deal, a 7.5% premium over the last Friday's close. Noble Energy investors are expected to vote on the deal Oct. 2.

Noble fell nearly 2% in trading Tuesday to \$9.52 a share as of 12:18 p.m. in New York.

Elliott has a history of buying stakes in companies and pushing for changes, including breaking up potential transactions. It's agitated at companies including AT&T Inc., Twitter Inc., and Softbank Group Corp., among others.

How to Fix East Med Border Disputes

The Eastern Mediterranean is once again at the center of what

can go wrong when countries fail to resolve decades-old disputes over offshore Exclusive Economic Zones (EEZs). On the face of it, the latest Greece-Turkey skirmish makes little sense now other than playing to domestic audiences and putting down markers to ensure a future piece of whatever this natural gas-rich part of the world has to offer. In today's brutal economic climate, few energy companies are lining up to undertake new projects, which means it will take longer for actual production to begin under the best circumstances. What's more, Turkey may not have the financial wherewithal or capacity to do the exploration and development work on its own, and no private energy company is likely to invest serious capital in a project that can be tied up for years by competing EEZ claims. This maximalist approach to solving maritime disputes will not work. Equitable results, perhaps based on the equidistance principle – a methodology endorsed by the 1994 UN Convention for Law of the Sea (UNCLOS) – would be the best way forward for settling the Greece-Turkey maritime boundary dispute.

The development of Israel's huge Leviathan natural gas field is a model studied closely by others in this region. Texas-based Noble Energy, which is now merging with Chevron, discovered Leviathan 10 years ago and quickly recognized that it was not only a world-class field, but that it needed an EEZ treaty for development to proceed without being contested by Cyprus. Noble carried out its own internal Law of the Sea desktop study, which became the basis for Israel's EEZ treaty with Cyprus. It also issued an ultimatum to the Israelis that no further exploration would take place until the EEZ deal was finalized. This pressure from Noble not only prompted the Israeli government to conclude a treaty with Cyprus, it did so in a document that explicitly states Israel must adhere to UNCLOS rules despite not being a signatory of the treaty. That in itself is an enormous change with broad economic implications.

While four of the seven recognized coastal states (Greece, Turkey, Syria, Cyprus, Lebanon, Israel and Egypt), are not signatories to the treaty, there is now a general understanding that even non-signatories to UNCLOS are increasingly ready to abide by its principles in settling disputes. The real threat to the East Mediterranean's prospects as an energy hub is politics, specifically the zero-sum games that have constricted and warped regional interactions. The best way to proceed is an orderly process in which Mediterranean maritime boundaries are fully delineated and individual countries are free to develop the resources within their respective EEZs. The UNCLOS contains a comprehensive rulebook for the fair and equitable resolution of such disputes by subjecting them to consistent legal standards and detailed scientific observations.

Necessary Conditions

Given the UNCLOS, the obvious question is: Why are we still talking about unresolved maritime boundaries in the Eastern Mediterranean? The short answer is that until recently few of the necessary conditions were in place. Since its inception, both technology and case law have evolved. Old colonial-era charts were highly unreliable, with depictions of even easily observable shoreline features off by a kilometer or more. New, accurate technological mapping has removed much of the guesswork. The outcome of any legal process based on UNCLOS can now be predicted with considerable reliability.

The Israel-Cyprus treaty has itself been challenged by Lebanon, which has alleged that its neighbors used faulty coordinates for its shoreline border with Israel, thereby mistakenly locating the offshore "tripoint" among the three countries' respective EEZs several kilometers from where it should be. But Israel has agreed to be bound by UNCLOS standards, making resolution possible. The situation also makes clear that precision mapping technology – now at the disposal of any government willing to pay for a Law of the Sea

study – has finally established a clear, objective basis for discussion.

In what could be a valuable point for both Turkey and Greece, this crucial degree of accuracy, often down to sub-meter measurements, should make it easier for governments to sell any agreements they reach to their respective publics. It also leaves too little room for naysayers at home or abroad to accuse anyone of backing down or selling out. German efforts to reconcile the interests of Turkey and Greece are commendable, and with precision mapping accuracy both governments can reduce economic and political pressure while simultaneously demonstrating the potential advantages of reconciliation.

Clear Benefits

The Eastern Mediterranean's emergence as an oil and gas hub promises a cure for the region's poverty and instability. The first discoveries were located in uncontested waters off Egypt and Israel, so development was fairly straightforward. In addition, most of the deposits were in the form of natural gas, whose cleaner properties and growing ubiquity as a global commodity, may give it better medium- and long-term market prospects than oil.

These discoveries and others that could follow are critical for the growing economies in the region, which need greater energy diversity and independence. Commercial interest in these resources also remains strong. Noble's East Mediterranean gas interests are considered one of the prize assets that Chevron was after in its bid. The energy majors already invested in offshore Cyprus, including the Exxon Mobil/Qatar Petroleum (QP) and Total/Eni consortia, have postponed – not canceled – exploratory drilling in their respective blocks. The involvement of QP is also a signal of long-term stability. As one of the world's most deep-pocketed national oil companies, its gas strategy is measured in

decades, as Energy Minister Saad al-Kaabi likes to say.

Even with the current extraordinary economic circumstances of the coronavirus pandemic, for which few companies and governments were prepared, the East Med should remain attractive and financially appealing going forward. The resources are still there and, while their current market value has been diminished, the potential deposits are still highly prized assets whose development, extraction and sale can be expected to generate many hundreds of billions of dollars over several decades. Despite the increasing competitiveness of renewables, the ubiquity and low carbon profile of gas will keep it in the global energy mix for years to come.

Roudi Baroudi is CEO of Energy and Environment Holding, an independent consultancy in Doha. His recent book, "Maritime Disputes in the Eastern Mediterranean: The Way Forward," is published by the Transatlantic Leadership Network and distributed by the Brookings Institution Press.

Debra Cagan is the Distinguished Energy Fellow at the Transatlantic Leadership Network. She is a former career US State Department and Defense Department official, having served from the Reagan to the Trump administrations.

**Climate Hawks Urge Biden to
Shun Obama-Era Energy
Moderates**

Climate-change activists are pressuring Joe Biden to distance himself from former Obama administration advisers they view as either too moderate or too cozy with the fossil-fuel industry, a sign of disunity on the eve of the Democratic convention.

Groups such as Data for Progress and the Revolving Door Project are building a case against some people advising the Democratic presidential nominee, such as former Energy Secretary Ernest Moniz and President Barack Obama's environment aide Heather Zichal. Both have served on the boards of companies linked to fossil fuels since leaving government.

The effort reflects simmering tension between the party's moderate nominee and progressives whose votes he needs to win. Polls show a lack of enthusiasm for Biden among young voters, something that could be exacerbated by open divisions within the environmental movement. But if climate activists succeed in pulling him to the left, it could cost him mainstream support.

The activists are collecting information on the advisers and formulating a strategy that could include a letter-writing campaign and petitions, similar to what has been employed to pressure Biden to sever ties with Obama's one-time National Economic Council Director Larry Summers. Summers is a contributor to Bloomberg Television.

Obama's record on cutting greenhouse-gas emissions was widely regarded as ambitious at the time. But activists say now there's no time left for anything other than a no-holds barred approach.

"If you want to maximize the effectiveness of a Biden administration on climate you need climate warriors," said Jeff Hauser, founder and director of the Revolving Door Project, which is assembling critical dossiers on the Biden advisers. "If you are going to take the climate crisis seriously you can't be seeking a middle-road solution."

Not everyone's on board with the activists' approach, with the election quickly approaching. Biden is close to naming a running mate as the party prepares for a trimmed down, four-day nominating convention in Milwaukee set to begin Aug. 17.

Bigger Objective

Some environmentalists prefer to focus on helping Biden defeat President Donald Trump and stop his rollback of environmental regulations. Trump, who is withdrawing the U.S. from the Paris climate treaty, has repeatedly called climate change a "hoax." By contrast, Biden's \$2 trillion plan for combating climate change won robust praise last month from across the spectrum of environmental advocacy groups.

Others worry that a climate purity test means muzzling some of the nation's top energy experts.

"It's OK right now that he's relying on those people, because he's got to focus on the primary objective – which is stopping the catastrophe we are in right now," said Brett Hartl, chief

political strategist for the Center for Biological Diversity Action Fund.

But critics say Biden's reliance on a stable of former Obama energy officials is already limiting the Democratic presidential candidate's climate ambition.

Read More: Biden Feels Heat From Left to Drop Larry Summers as an Adviser

"The people who built the system and are profiting from it are not going to want to tear it down," said Collin Rees, a senior campaigner with Oil Change U.S., an environmental group that advocates shifting away from fossil fuels.

Other aides to Obama who have drawn the ire of climate activists include one-time White House energy adviser Jason Bordoff, State Department official Amos Hochstein and economic adviser Brian Deese.

None of the targeted officials are employed by the Biden campaign, though Zichal, Bordoff and Moniz have informally advised it, according to people familiar with the matter who asked not to be identified. And the campaign is widely consulting outsiders; senior campaign officials said they conferred with scientists and leaders of the environmental justice movement in developing Biden's \$2 trillion climate plan.

The activists point to signs of caution, including language in a Biden-Sanders unity task force report that rules out public financing of overseas coal projects but leaves the door open for supporting natural gas ventures.

Obama's Record

Some environmental activists are advancing an array of choices deemed acceptable as possible cabinet members – from Washington Governor Jay Inslee for Interior secretary to California Air Resources Board Chair Mary Nichols

as Environmental Protection Agency administrator.

Biden is naturally relying on advice from some of Obama's old hands, having worked with many of the same advisers during his eight years as vice president, Hartl said.

Activists say they are most concerned by what Biden's team has done in recent years – not the policies they pushed as part of the Obama administration.

“We are gearing up,” said RL Miller, chair of California Democratic Party's environmental caucus and a member-elect to the Democratic National Committee. “We will be exposing the flaws in these people's records as climate peacocks and we will be making it toxic for Joe Biden to be taking advice on matters of energy from them.”

LNG Exports

Zichal has served on the board of Cheniere Energy Inc., which became the first major U.S. exporter of shale gas in 2016, and has stressed the need to find a “middle ground” environmental policy. She also continues to promote marine protections and sustainability as head of the Blue Prosperity Coalition, has discouraged new offshore drilling off South Africa and previously was vice president of corporate engagement for the Nature Conservancy. Zichal declined to comment.

Bordoff has served on the National Petroleum Council, an Energy Department advisory group that includes oil company executives. He also founded a Columbia University energy policy center affiliated with the School of International Public Affairs Center. It draws funding from oil companies, climate-focused groups and other organizations, including Bloomberg Philanthropies, the charitable organization founded by Michael R. Bloomberg, the majority owner of Bloomberg LP. Like Summers, Bordoff has praised energy exports, noting earlier this year that increased foreign sales of liquefied natural gas help lower the price of the fossil fuel that can

displace dirtier-burning coal in generating electricity. He has also warned about “dwindling time” to make progress fighting climate change and last month argued the issue should be “squarely at the center of U.S. foreign policy.”

Bordoff is helping guide Columbia University’s creation of a climate school and develop a public database with environmental groups to track whether countries are spending Covid-19 recovery dollars to underwrite fossil fuels or clean energy.

“Throughout his career in policy and academia, Jason has focused on the urgency of the climate crisis and worked to achieve more rapid and ambitious action to achieve net-zero emissions by 2050,” said Artealia Gilliard, the Center on Global Energy Policy spokeswoman.

Deep Decarbonization

Moniz, an informal adviser to the Biden campaign, has joined the board of Southern Co., a utility that generates power from natural gas, coal, nuclear and renewables. He also proposed a “Green Real Deal” alternative to the “Green New Deal” backed by progressives. He’s drawn fire for forming a partnership with the AFL-CIO that endorses an “all-of-the-above” climate change strategy.

David Ellis, a spokesman for the Energy Future Initiative, a think tank led by Moniz, declined to comment. But he pointed to testimony Moniz gave earlier this year saying he “endorses a focus on the simultaneous needs for achieving deep decarbonization and ensuring that social equity issues are central in the clean energy transition.”

Hochstein, a former special envoy and coordinator for international affairs under Obama, worked with the State Department to ensure American energy companies had access to global oil fields. More recently, he has warned of the need to

stabilize oil-dependent nations as the world moves away from petroleum and has stressed the importance of natural gas in buttressing renewable power.

“I am not advising the Biden campaign, and I fully and 100% support the climate agenda that the campaign has laid out,” Hochstein said.

Deese, an economic adviser to Obama, now works on sustainability issues at investment firm BlackRock Inc. While BlackRock has announced plans to stop investing in companies generating more than a quarter of their profits from coal production, environmentalists say the company hasn't gone far enough. A BlackRock spokesman said Deese sits on the board of the environmental group League of Conservation Voters and helped negotiate the Paris climate agreement during his time in the Obama administration.

Biden should be getting advice from people who recognize there needs to be an end to fossil fuels instead of embracing “false solutions” that allow the construction of more oil pipelines and gas development for decades to come, said Rees, the Oil Change U.S. official.

“Ten years ago, we were certainly in a different place,” Rees said. “Today, there's no lack of powerful voices, there's no lack of people who know their stuff, there's no excuse for essentially defaulting to energy consultants when you are talking about these kinds of things.”

MTV – Turkey-Greece conflict in eastern Mediterranean

بعد التوتر اليوناني - التركي
حول النفط: بارودي يحذر من
نزاع مسلح جديد

تصاعدت التوترات بين اليونان وتركيا في الفترة الأخيرة بعدما أرسلت أنقرة سفينة للتنقيب عن النفط بالقرب من منطقة تطالب بها أثينا.

خبير الطاقة الدولي رودي بارودي أجرى في حديث لـ"سبوتنيك"، تقييماً للوضع المتفجّر بين الطرفين، فقال: إذا لم تلتزم الأطراف بالمبادئ ذاتها الناتجة عن اتفاقية الأمم المتحدة لقانون البحار، ولم تسارع إلى إيجاد أرضية مشتركة، فإن مخاطر النزاع المسلح جدية. فتركيا واليونان يمكنهما الاستئناف أمام المحاكم الدولية،

ويمكنهما كذلك اللجوء إلى التحكيم إذا فشل الطرفان في الاتفاق على شكل من أشكال الإجراءات الدبلوماسية التقليدية لحل مطالبهما الإقليمية المتداخلة.

ووفق بارودي "يمكن ان يكون هناك حل عادل لكلا الطرفين، حل ينطلق من "منطق محايد" لقانون البحار، والذي تم استخدامه في مناسبات عدة في أجزاء أخرى من العالم لحل النزاعات سلمياً. ويمكن لشركات التي تقدم حلولاً متقدمة لرسم الخرائط و/ أو تستخدم Fugro مثل خرائط عالية الدقة للشواطئ، أن تقدم سريعاً "نتائج دقيقة ومتسقة" لكل ولاية". وتابع: هذا هو الطريق: الاعتماد على القانون والعلم والقواعد المعمول بها... وليس على التهديدات والشرائع.

وتعليقاً على الاتفاقات التي وقعتها من أجل إعادة تحديد حدودها البحرية، تركيا مع ليبيا في عام 2019 من جهة، واليونان مع مصر في 6 آب من جهة أخرى، وما إذا كانت هذه المعاهدات معترف بها من قبل الدول المجاورة والمجتمع الدولي، قال بارودي "في الوضع الراهن، حددت هذه الدول الساحلية الحدود البحرية التي يبدو أنها تضم مناطق متداخلة ولا يزال لدى الدولتين الحق في رسم مثل هذه الحدود بموجب القانون الدولي، لكن هذه المعاهدات تلزم فقط تلك الدول". التي تصادق عليها وليس دولاً ثالثة.

**Conflit maritime gréco-turc:
«les tensions pourraient
conduire à un réel conflit
armé»**

La tension est à son comble entre la Grèce et la Turquie depuis l'envoi par Ankara d'un navire de recherche près d'une zone revendiquée par Athènes. Selon Roudi Baroudi, expert en énergie et des conflits en Méditerranée, si les parties ne trouvent pas rapidement un terrain d'entente, les risques d'un conflit armé sont réels. Entretien.

Rien ne va plus entre Athènes et Ankara depuis qu'un navire turc consacré à la recherche sismique a été envoyé tout près de l'île grecque de Kastellorizo. Aussi connue sous le nom de Megísti, l'île est située à deux kilomètres des côtes turques et à environ 580 kilomètres d'Athènes. Après avoir brièvement suspendu ses recherches d'hydrocarbures, Ankara a annoncé que son opération allait reprendre. Pour soutenir la Grèce, la France a décidé de renforcer sa présence dans les eaux disputées.

Pour faire le point sur cette situation explosive, Sputnik s'est entretenu avec Roudi Baroudi, spécialiste de l'énergie internationalement reconnu. M.Baroudi a notamment travaillé en collaboration avec la Banque mondiale, le FMI, la Commission européenne, l'Agence des États-Unis pour le développement international et le Fonds arabe pour le développement économique et social. Il vient de publier le livre *Maritime*

Disputes in the Eastern Mediterranean (Éd. Brookings), consacré aux conflits en Méditerranée.

Sputnik: Est-ce le début d'un conflit majeur?

Roudi Baroudi: «La première chose à considérer est que si les parties n'adhèrent pas aux mêmes principes découlant de la Convention des Nations unies sur le droit de la mer, le différend ne peut pas prendre fin. Si tel est le cas, les 20 prochaines années ne peuvent que ressembler aux 20 dernières années: les tensions vont persister ou, pire, conduire à un réel conflit armé.

La réalité est que ces derniers jours, le navire d'exploration turc a effectué des tirs sismiques dans une zone qui ferait presque certainement partie de la Zone économique exclusive reconnue de la Turquie si les parties appliquaient les principes de la Convention des Nations unies sur le droit de la mer et respectaient celui d'équidistance. C'est un constat auquel les parties pourraient en venir si elles voulaient en arriver à une solution équitable tenant compte de toutes les caractéristiques de la zone immédiate. Autrement dit, si les deux pays s'engageaient à négocier une solution équitable "à la lettre", en mettant en œuvre les règles établies dans le cadre de la Convention des Nations unies sur le droit de la mer.»

Sputnik: Selon l'expert Christian Fleury, interrogé récemment par Sputnik, la Méditerranée regorge de conflits potentiels de ce type. La Méditerranée peut-elle vraiment devenir une poudrière à cause de la recherche d'hydrocarbures?

Roudi Baroudi: «Eh bien, cela est vrai en Méditerranée orientale où le conflit israélo-arabe, par exemple, dure depuis plus de 75 ans et en raison d'autres facteurs. Néanmoins, si les dirigeants de la région devaient s'asseoir et s'engager véritablement à résoudre leurs différends pacifiquement –comme ils sont tenus de le faire en vertu de la

charte des Nations unies et tenus d'utiliser les structures de partenariat de l'UE disponibles—, je ne doute pas qu'ils pourraient finir par conclure des accords qui isolent la recherche de profits liée aux hydrocarbures des effets de leurs désaccords politiques.

À certains égards, cela s'applique en particulier à la Grèce et à la Turquie. Ces deux pays sont actuellement dirigés par des individus dont les référents nationalistes les encourageraient sans doute à parvenir à un accord. Il est important de noter que si la Grèce et la Turquie ont déclaré unilatéralement leurs frontières maritimes hypothétiques, aucune de leurs revendications n'a été enregistrée, publiée ou même déposée auprès de la Division des affaires maritimes et du droit de la mer des Nations unies, ce qui signifie qu'elles ne sont pas reconnues internationalement.

Il existerait une solution équitable pour les deux parties, celle qui procède d'une "logique neutre" du droit de la mer et qui a été utilisée à plusieurs reprises dans d'autres parties du monde pour résoudre pacifiquement des conflits similaires. Cette solution tiendrait compte des petites îles grecques isolées tout en offrant le meilleur compromis aux deux États côtiers pour l'ensemble de la mer Méditerranée.»

Sputnik: Selon vous, la Turquie et la Grèce devraient donc faire appel aux tribunaux internationaux?

Roudi Baroudi: «C'est définitivement une option, tout comme l'arbitrage, si les parties ne parviennent pas à se mettre d'accord sur une forme de procédure diplomatique conventionnelle pour résoudre leurs revendications territoriales qui se chevauchent. Quelle que soit la manière de dialoguer, tant qu'ils acceptent de suivre les principes de la Convention des Nations unies sur le droit de la mer, les progrès récents de la technologie rendent le résultat des négociations beaucoup plus prévisible qu'il ne l'aurait été auparavant.

Des entreprises comme Fugro offrant des solutions de cartographie avancées et/ou utilisant une cartographie de haute précision du littoral peuvent fournir rapidement et précisément des ‘‘résultats reproductibles cohérents’’ pour chaque État (ou d’autres entités) comme jamais auparavant. Ces nouvelles technologies tournent la page de décennies de méfiance, laquelle a toujours représenté un grave problème quand il fallait définir des frontières maritimes offshore.

Ces nouvelles technologies permettent une cartographie précise des points de terminus terrestre (les régions frontalières de l’interface terre-mer), et en mer, des points de trijonction, c’est-à-dire là où, précisément, les Zones économiques exclusives de trois États côtiers se rencontrent pour former un point commun. Ces nouvelles technologies éliminent d’autres éléments sur lesquels il pourrait y avoir des différends et facilite l’interprétation de la Convention des Nations unies sur le droit de la mer afin que les deux parties obtiennent une ‘‘victoire’’ de manière équitable.

La Grèce et la Turquie ont la possibilité de suivre, entre autres, l’exemple des règlements des litiges ayant opposé le Bangladesh et le Myanmar, le Nicaragua et le Honduras, la Libye et la Tunisie, etc. C’est la voie à suivre: s’appuyer sur la loi, la science et les règles en vigueur et non sur les menaces et les canons.»

Sputnik: Afin de redéfinir leurs frontières maritimes, la Turquie a signé un accord avec la Libye en 2019 tandis que la Grèce en a signé un avec l’Égypte le 6 août dernier. Ces traités sont-ils reconnus par les États voisins et la communauté internationale?

Roudi Baroudi: «Dans la présente situation, ces deux paires d’États côtiers ont défini des frontières maritimes extracôtières qui semblent avoir des zones de revendication qui se chevauchent. Pour chaque paire d’États côtiers (la Turquie et la Libye ainsi que la Grèce et l’Égypte), ces

accords peuvent être considérés comme des tentatives de définir de nouvelles frontières bilatéralement. Cependant, étant donné que les accords provisoires potentiels ne prenaient pas en considération les effets possibles sur les droits des États voisins, ils sont uniquement considérés comme des accords bilatéraux. Deux pays ont toujours le droit de tracer ce genre de frontières en vertu du droit international, mais ces traités n'engagent que les pays qui les ratifient et jamais les pays tiers.»

EU Members Protest U.S. Sanctions After Nord Stream Threats

Twenty-four European Union countries complained to the U.S. State Department this week over President Donald Trump's expansive use of sanctions to help influence American foreign

policy goals, according to a European diplomat familiar with the communication.

The message, supported by all but three of the bloc's member states, was given on Wednesday, said the diplomat, who asked not to be identified because the correspondence hasn't been made public.

The so-called demarche was based on a July 17 statement by the EU's top foreign policy official, Josep Borrell, in which he condemned U.S. intimidation tactics. He specifically cited Trump's sanctions aimed at halting construction of the Nord Stream 2 gas pipeline, which would link Russia and Germany.

"Our actions are aimed at curbing Russia's malign activity," according to an emailed statement from a State Department spokesperson. "We continue to work with our European partners to make it clear that Nord Stream 2 enables Russia to use its energy supplies as a political weapon in Europe and undermine Ukrainian security."

Relations between the U.S. and the EU – and Germany in particular – have plumbed new lows, with Trump hitting his transatlantic allies with sweeping tariffs and pulling out of multilateral agreements such as the Paris climate accord and the Iran nuclear deal. Trump also announced plans to withdraw about 12,000 troops from Germany last month, saying Chancellor Angela Merkel's government had been "delinquent" on defense spending.

'Illegal' Sanctions

"There was an informal outreach which the EU member states could join on a voluntary basis," EU Spokeswoman Nabila Massrali told reporters on Friday when asked about the complaint. She added that the U.S. threatening sanctions

against European companies was “part of a wider, worrying trend.”

The Nord Stream 2 gas pipeline has become a central point of tension between Merkel and Trump, who has blasted the project for sending “billions” to Russia. Merkel has called new sanctions aimed at the gas route illegal. Still, there is no consensus among the EU on Nord Stream, with countries such as Poland condemning the pipeline for bypassing eastern Europe and increasing the bloc’s reliance on Russian energy.

Last week, three Republican Senators ratcheted up tensions with a letter warning that a German Baltic Sea port would face “crushing legal and economic” sanctions if it continued to participate in the completion of the pipeline. Mukran Port, located in Merkel’s constituency, is a supply base for the 1,200-kilometer (745-mile) undersea pipeline.

German Foreign Minister Heiko Maas this week said EU member states would discuss to what extent extraterritorial sanctions violate international law, as he renewed his condemnation of U.S. threats.

“No state has the right to dictate Europe’s energy policy with threats – and it won’t work,” Maas told reporters Monday alongside Russian Foreign Minister Sergei Lavrov during a daylong visit to Moscow.

All stakeholders of Nord Stream 2 still aim to complete the gas link, Lavrov said at the briefing. “There are reasons to assume that it will be done in the near future.”
